Unconventional
superconductor families:

Heavy fermions

$T_c \sim 2 \text{ K}$

1979

Organics

$T_c \sim 10 \text{ K}$

1990

Cuprates

$T_c \sim 100 \text{ K}$

1987

Iron Arsenides

$T_c \sim 40 \text{ K}$

2008

Superconductor families

Conventional:

- Well described by BCS theory
- Cooper pairing driven by phonons
- Typically elements or simple compounds
- (Al, Hg, MgB_2 , Nb_3Sn , Nb-Ti alloy...)
- Zero spin and angular momentum

Unconventional:

- Unknown pairing mechanism (spin fluctuations?)
- Finite spin or angular momentum
- Often found in close to (anti)ferromagnetism

The Iron Arsenide Family

Well characterized
single crystals

T_c up to 55 K in SmFeAsO

Canfield and Bud'ko, Annu. Rev.
Condens. Matter Phys. (2010)

Hideo Hosono,
Tokyo Inst. Tech.

Superconductivity and Magnetism

Antiferromagnetic metal

Goldman et al, PRB 79 24593
(2008)

Electron or hole
doping
Or pressure

Zero resistance

Hosono et al., Nature 2008

Phase Diagram

Superconductivity and Antiferromagnetism are ubiquitous

But the details are very different!

Orthorhombic Distortion

$I4/mmm$

F/mmm

Fisher et al., Science (2010)

$(a-b)/a \sim 1\%$

Magnetic Order

Stripe ordering:

$$\mathbf{Q}_{AF} = (\pi/a, 0, \pi/c)$$

Moments point along (100)

First order for pure compound

Goldman et al, PRB 79 24593
(2008)

Material	Ordered Moment
CaFe_2As_2	$0.80 \mu_B$
BaFe_2As_2	$0.87 \mu_B$
SrFe_2As_2	$1.01 \mu_B$
LaFeAsO	$0.4 \mu_B$

As NMR

As

^{75}As $I=3/2$ is 100% abundant

+1/2 to -1/2
transition

Canfield and Bud'ko, Annu. Rev. Condens. Matter Phys. (2010)

As Hyperfine Coupling

$$H_{\text{int}} = \sum_{i \in \text{nnFe}} \mathbb{B}_i \cdot \mathbf{S}(\mathbf{r}_i)$$

$$K_{\alpha} = B_{\alpha} \chi_{\alpha}$$

Knight shift in
paramagnetic state
probes static
susceptibility

Nuclear Spin Dynamics

$|I_z = +\frac{1}{2}\rangle$

$|I_z = -\frac{1}{2}\rangle$

By applying rf pulses, we can perturb the equilibrium Boltzmann distribution, and then watch as the system relaxes to a finite spin temperature

$$M(t) \sim 1 - e^{-t/T_1}$$

$$(T_1 T)^{-1} \sim \lim_{\omega \rightarrow 0} \frac{\chi''(\mathbf{q}, \omega)}{\omega}$$

Outline

- The Iron Superconductors

- Glassy Dynamics and Inhomogeneity
- Nematicity and Disorder

Spin Lattice Relaxation

Divergence reveals critical slowing down of magnetic fluctuations at AFM phase transition

Critical Slowing Down

High temperature, random fluctuations

Near transition, slow correlated fluctuations

Low temperature, long-range order

Under the Rug: A Closer Look

Not all the nuclei see the same fluctuations!

Dynamical Heterogeneity

$$M(t) = \int \underbrace{\mathcal{P}(W_1)}_{\text{Distribution of relaxation rates}} \underbrace{f(W_1 t)}_{1 - e^{-W_1 t}} dW_1$$

*Distribution of
relaxation rates*

$$1 - e^{-W_1 t}$$

$\mathcal{P}(W_1)$ characterized by two parameters
(fit to log-normal distribution):

$$T_1^{-1} \text{ and } \sigma_1$$

Temperature Dependence

Standard deviation σ_1 increases by 2 orders of magnitude below 100 K

Signal Wipeout

$$M \sim \frac{H}{T}$$

Wipeout coincides with onset of dynamical heterogeneity

Glassy Behavior

- General feature in statistical mechanics when ergodicity is broken (structural glasses, polymers, spin glasses, etc.)
- symmetry breaking in systems with **disorder**

Dynamical Heterogeneity

Parisi and Sciortino, Nat. Mat. 2013

Doping Dependence

Dynamical inhomogeneity develops below 100 K, and is more pronounced near the critical doping $x = 0.07$

- Glassy behavior also has been reported via NMR in:
 $\text{LaFeAs}(\text{O},\text{F})$ (Hammerath PRB 2013) , $\text{Ba}(\text{Fe},\text{Rh})_2\text{As}_2$ (Bossoni, PRB 2013), and $\text{Ba}(\text{Fe},\text{Cu})_2\text{As}_2$ (Imai, PRL 2014)

Outline

- Nuclear Magnetic Resonance
- Glassy Dynamics and Inhomogeneity
- Nematicity and Disorder

Nematic Order

Detwin under uniaxial strain
Chu et al., Science 2010

Nematic Susceptibility

Chu et al., Science 2012

Apply strain ε_p , measure
nematicity $\eta = \Delta\rho/\rho_0$

Fluctuation-dissipation theorem:
nematic fluctuations in paramagnetic state

Nematic Fluctuations Drive Spin Fluctuations

Fernandes et al., PRL 2013

**Magnetoelastic coupling leads to scaling
between shear modulus and NMR $T_1 T$**

Effect of Disorder

- Nematic order has Ising symmetry
- Dopants/disorder introduce local field gradients $\rightarrow$ act as random field
- Random fields in Ising model (Imry & Ma PRL 1975):
- Suppression of long range nematic order
- Inhomogeneous glassy dynamics

Carlson and Dahmen, Nat. Comm. 2010

Carlson et al., PRL 2006

Mezard & Monnason, PRB 1994

Random Field Ising Model

$$H = -J \sum_{\langle i,j \rangle} \sigma_i \sigma_j - \sum_i (h + h_i) \sigma_i$$

*randomly distributed field
from local disorder/dopants*

(a) Color visualization

(b) Stripe visualization

Temperature Dependence

Conclusions

- NMR reveals ***dynamical inhomogeneity***
- Glassy dynamics persists up to 100 K in a broad range of materials (Ni, Co, Cu, Rh, P doped BaFe_2As_2 , $\text{LaFeAsO}_{1-x}\text{F}_x$)
- Frozen AF clusters coexist with SC
- Likely origin is ***disorder in the vicinity of the nematic quantum critical point***
